## Sequential Electroretinogram (SERG) Driver Notes and Parts List

Notes: The driver circuit operates a high power LED with resolution of pulses from < 10 microseconds. The visible light can be in excess of $10,000,000$ trolands and requires attention to eye safety. Light output and timing may be controlled by the driver or light pulses may be controlled externally by a waveform or pulse generator. The circuit is designed to operate with logic pulses of $>3$ volts or various shaped positive signals. Light output is independent of repetition rate.

Circuit Discussion: Function is controlled by SW 1. In position 3, a positive control pulse is amplified > 5 volts by amplifiers $\mathrm{A}, \mathrm{B}$, and with input to timer C. Chosen-time square wave is amplified up to saturation by VR5 and amplifier E and input to power amplifier F. F drives the power LED up to 800 ma , continuous or with time spacing from Trigger In. Switch 1 position 2 leads to no internal timing and sends the B amplified direct signal to the power driver E, F. Switch 1 position 1 positive trigger In is amplified and toggles on-off by flip-flop D. The on-off signal (external timing) drives E and F which control brightness.
Internal timing provided by C ranges from 1 msec to 110 msec , time controlled by VR6. Diagram resolution is best after printing.

Power supplies: $+-15 \mathrm{v}>1 \mathrm{amp},+5 \mathrm{v}>100$ mamp.

## Parts:

IC Devices: A \& B = LM 1458, double opamp amplifier. C = LM555, timer chip. $\mathrm{D}=7473$ flip-flop. $\mathrm{E}=\mathrm{AD711}$, opamp amplifier. $\mathrm{F}=$ LH002, power amplifier. Power LED = BWL-3A4A02H. 700 ma continuous; color temperature, 6500 K ; viewing angle 120 degrees; radiant power $=300 \mathrm{mw}$. (Bright LED electronics Corporation 3FI\#19 Ho Ping Road Panchais, 220 Taipei Hsien, Taiwan; Telephone +886 22959 1090; Contact Danny Yee, service @brtled.com) or (American Bright, 13815-C Magnolia Ave, Chino, Ca 91710. (telephone 909-628-5050)

Diodes 1-6 $=1$ N4008 or 1N4148
Resistors: R1-R16, ¼ watt; VR1 - 6, control potentiometers

| $\mathrm{R} 1=4.6 \mathrm{~K}$ | $\mathrm{R} 8=1.5 \mathrm{M}$ | $\mathrm{R} 15=2.7 \mathrm{~K}$ |
